

```
read_*(file, col_names = TRUE, col_types = NULL, col_select = NULL, id = NULL, locale, n_max = Inf,  
skip = 0, na = c("", "NA"), guess_max = min(1000, n_max), show_col_types = TRUE) See ?read_delim
```

read_delim("file.txt", delim = "|") Read files with any delimiter. If no delimiter is specified, it will automatically guess.
To make file.txt, run: write_file("A|B|C\n1|2|3\n4|5|NA", file = "file.txt")

```
read_csv("file.csv") Read a comma delimited file.  
write_file("A,B,C\n1,2,3\n4,5,NA", file = "file.csv")
```

read_csv2("file2.csv") Read files in locales with comma decimal marks and semicolon delimiters. Also see the **locale** argument.

```
write_file("A;B;C\n1,5;2,25;3\n4,25;5,5;6", file = "file2.csv")
```

```
read_tsv("file.tsv") Read a tab delimited file. Also read_table().  
read_fwf("file.tsv", fwf_widths(c(2, 2, NA))) Read a fixed width file.  
write_file("A\\tB\\tC\\n1\\t2\\t3\\n4\\t5\\tNA\\n", file = "file.tsv")
```

Read values as missing

```
read_csv("file.csv", na = c("1"))
```

```
write_*(x, file, na = "NA", append, col_names, quote, escape, eol, num_threads, progress)
```

- write_csv(x, file)** Write a comma delimited file.
- write_csv2(x, file)** Write a semi-colon delimited file.
- write_delim(x, file, delim = " ")** Write files with any delimiter.
- write_tsv(x, file)** Write a tab delimited file.

The back page shows how to import spreadsheet data from Excel files using **readxl** or Google Sheets using **googlesheets4**.

character

- **haven** - SPSS, Stata, and SAS files
- **DBI** - databases
- **jsonlite** - json
- **xml2** - XML
- **httr** - Web APIs
- **rvest** - HTML (Web Scraping)
- **readr::read_lines()** - text data

```
# col types: skip, guess, integer, logical, character
read_csv(file, col_type = "?ilc")
```

Import Spreadsheets with readxl

READ EXCEL FILES

	A	B	C	D	E
1	x1	x2	x3	x4	x5
2	x		z	8	
3	y	7		9	10

s1

read_excel(path, sheet = NULL, range = NULL)
Read a .xls or .xlsx file based on the file extension. See front page for more read arguments. Also **read_xls()** and **read_xlsx()**.
`read_excel("excel_file.xlsx")`

READ SHEETS

A	B	C	D	E

s1 s2 s3

read_excel(path, sheet = NULL) Specify which sheet to read by position or name.
`read_excel(path, sheet = 1)`
`read_excel(path, sheet = "s1")`

s1 s2 s3

excel_sheets(path) Get a vector of sheet names.
`excel_sheets("excel_file.xlsx")`

A	B	C	D	E

s1 s2 s3

To read multiple sheets:

1. From a file path, create a vector of sheet names.
2. Set the vector names to be the sheet names.
3. Use `purrr::map_dfr()` to read multiple files into one data frame

```
path <- "your_file_path.xlsx"
path %>% excel_sheets() %>%
  set_names() %>%
  map_dfr(read_excel, path = path)
```

OTHER USEFUL EXCEL PACKAGES

For functions to write data to Excel files, see:

- **openxlsx** - [johndcoker.github.io/openxlsx/](https://github.com/johndcoker/openxlsx)
- **writexl** - docs.ropensci.org/writexl/

For working with non-tabular Excel data, see:

- **tidyxl** - nacnudus.github.io/tidyxl/

READXL COLUMN SPECIFICATION

Column specifications define what data type each column of a file will be imported as.

Use the **col_types** argument of **read_excel()** to set the column specification.

Guess all columns

To guess, **read_excel()** looks at the first 1000 rows of data to guess what type a column is. Increase with the **guess_max** argument.

```
read_excel(path, col_types = NULL,
            guess_max = Inf)
```

Set all columns to same type, e.g. character

```
read_excel(path, col_types = "text")
```

Set each column individually

```
read_excel(path,
            col_types = c("text",
                          "guess",
                          "guess",
                          "numeric"))
```

COLUMN TYPES

logical	numeric	text	date	list
TRUE	2	hello	1947-01-08	hello
FALSE	3.45	world	1956-10-21	1

- skip
- guess
- logical
- numeric
- text
- date
- list

Use **list** for columns that include multiple data types. See **tidyr** and **purrr** for list-column data.

A	B	C	D	E
1	2	3	4	5
x		y	z	
6	7		9	10

s1

2	3	4
NA	y	z

with googlesheets4

READ SHEETS

	A	B	C	D	E
1	x1	x2	x3	x4	x5
2	x		z	8	
3	y	7		9	10

s1

read_sheet(ss, sheet = NULL, range = NULL)
Read a sheet from a URL, a Sheet ID, or a dribble from the googledrive package. See front page for more read arguments. Same as **range_read()**.

SHEETS METADATA

URLs are in the form:

```
https://docs.google.com/spreadsheets/d/
SPREADSHEET_ID/edit#gid=Sheet_ID
```

gs4_get(ss) Get spreadsheet meta data.

gs4_find(...) Get data on all spreadsheet files.

sheet_properties(ss) Get a tibble of properties for each worksheet. Also **sheet_names()**.

WRITE SHEETS

	A	B	C
1	x	4	
2	y	5	
3	z	6	

s1

A	B	C	D
1			
2			

s1

x1	x2	x3
1	x1	x2
2	y	5
3	z	6

s1

write_sheet(data, ss = NULL, sheet = NULL)
Write a data frame into a new or existing Sheet.

gs4_create(name, ..., sheets = NULL) Create a new Sheet with a vector of names, a data frame, or a (named) list of data frames.

sheet_append(ss, data, sheet = 1) Add rows to the end of a worksheet.

GOOGLESHEETS4 COLUMN SPECIFICATION

Column specifications define what data type each column of a file will be imported as.

Use the **col_types** argument of **read_sheet()** or **range_read()** to set the column specification.

Guess all columns

To guess, **read_sheet()/range_read()** looks at the first 1000 rows of data to guess what type a column is. Change with **guess_max**.

```
read_sheet(path, col_types = NULL,
            guess_max = Inf)
```

Set all columns to same type, e.g. character

```
read_sheet(path, col_types = "c")
```

Set each column individually

```
# col types: skip, guess, integer, logical, character
read_sheets(ss,
            col_types = "_?ilc")
```

COLUMN TYPES

l	n	c	D	L
TRUE	2	hello	1947-01-08	hello
FALSE	3.45	world	1956-10-21	1

- skip - "_" or "-"
- guess - "?"
- logical - "l"
- integer - "i"
- double - "d"
- numeric - "n"
- date - "D"
- datetime - "T"
- character - "c"
- list-column - "L"
- cell - "C" Returns list of raw cell data.

Use list for columns that include multiple data types. See **tidyr** and **purrr** for list-column data.

FILE LEVEL OPERATIONS

googlesheets4 also offers ways to modify other aspects of Sheets (e.g. freeze rows, set column width, manage (work)sheets. Go to googlesheets4.tidyverse.org to read more.

For whole-file operations (e.g. renaming, sharing, placing within a folder), see the tidyverse package **googledrive** at googledrive.tidyverse.org.
