# Tibbles - an enhanced data frame

The **tibble** package provides a new S3 class for storing tabular data, the tibble. Tibbles inherit the data frame class, but improve three behaviors:

- Subsetting [ always returns a new tibble, [[ and \$ always return a vector.
- No partial matching You must use full column names when subsetting

Display - When you print a tibble, R provides a

 Control the default appearance with options: options(tibble.print\_max = n, tibble.print\_min = m, tibble.width = Inf)

data frame display

- View full data set with View() or glimpse()
- Revert to data frame with as.data.frame()

### **CONSTRUCT A TIBBLE IN TWO WAYS**

to display

as\_tibble(x, ...) Convert data frame to tibble.

enframe(x, name = "name", value = "value") Convert named vector to a tibble

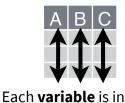

is tibble(x) Test whether x is a tibble.

# Tidy Data with tidyr

**Tidy data** is a way to organize tabular data. It provides a consistent data structure across packages.

A table is tidy if:

its own column

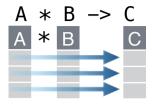

Each **observation**, or case, is in its own row

Tidy data:

Makes variables easy to access as vectors

Preserves cases during vectorized operations

## Reshape Data - change the layout of values in a table

Use **pivot longer()** and **pivot wider()** to reorganize the values of a table into a new layout.

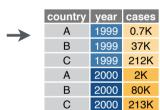

pivot\_longer(data, cols, names\_to = "name", names\_prefix = NULL, names\_sep = NULL, names\_pattern = NULL, names\_ptypes = list(), names transform = list(), names repair = "check\_unique", values\_to = "value", values\_drop\_na = FALSE, values\_ptypes = list(), values\_transform = list(), ...

pivot longer() pivots cols columns, moving column names into a names to column, and column values into a values to column.

table4a country 1999 2000 0.7K

212K 213K

37K

pivot\_longer(table4a, cols = 2:3, names\_to = "year", values\_to = "cases") **pivot wider**(data, id\_cols = NULL, names\_from = name, names\_prefix = "", names\_sep = "\_", names\_glue = NULL, names\_sort = FALSE, names\_repair = "check\_unique", values\_from = value, values\_fill = NULL, values\_fn = NULL, ...)

pivot\_wider() pivots a names\_from and a values from column into a rectangular field of cells.

table2

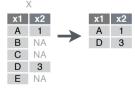

country	year	type	count		country	year	cases
Α	1999	cases	0.7K	_	Α	1999	0.7K

В	2000	рор	174M				
С	1999	cases	212K				
С	1999	pop	1T				

pivot\_wider(table2, names\_from = type, values from = count)

# Handle Missing Values

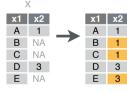

drop\_na(data, ...)

Drop rows containing NA's in ... columns.

 $drop_na(x, x2)$ 

fill(data, ..., .direction = c("down", "up")) Fill in NA's in ... columns with most recent non-NA values.

fill(x, x2)

replace\_na(data, replace = list(), ...Replace NA's by column.

 $replace_na(x, list(x2 = 2))$ 

# Expand Tables - quickly create tables with combinations of values

complete(data, ..., fill = list())

values of the variables listed in ... complete(mtcars, cyl, gear, carb)

expand(data, ...)

Adds to the data missing combinations of the Create new tibble with all possible combinations of the values of the variables listed in ... expand(mtcars, cyl, gear, carb)

# Split Cells

Use these functions to split or combine cells into individual, isolated values.

**separate**(data, col, into, sep = "[^[:alnum:]] +", remove = TRUE, convert = FALSE, extra = "warn", fill = "warn", ...)

Separate each cell in a column to make several columns.

table3
